MyController.org

The Open Source Controller

Author(s)	Product Version	Date
Jeeva Kandasamy	0.0.3-alpha2	July-2016

Copyright ©2015-2016, All Rights Reserved, <http://www.mycontroller.org>

Introduction

MyController.org is a controller for the sensors world! Primarily it was developed to MySensors.org project. Later changed it's architecture to support other projects also. Currently supports for [MySensors](#) and [Sparkfun](#). Considered system resources in mind on development. As a result even we can run it on Raspberry PI very first model.

You can control/monitor various sensors with this controller. As this controller is a web application server you can access from anywhere if you have internet/intranet connection. It has various features like, firmware control for nodes, powerful rule engine, timers, custom scripts support(JavaScript, Python, Ruby, Groovy, etc.,). For further details dig into each section.

If you think [MyController.org](#) helps you someway on your daily life, kindly consider to [donate](#) something to MyController. Your donation will help MyController to keep growing. Thank you!

Do you have question? Post your questions on [forum](#) or you can ping at [gitter chat](#)

Technology

MyController.org is Java based web application server.

- Web Server : [TJWS](#)
- REST-API : [Jboss RestEasy](#)
- Database : [h2 database](#)
- MQTT Broker : [andsel/moquette](#)
- Front-end : [AngularJS](#), [PatternFly](#)

Installation

System Requirements

MyController.org server is very lightweight, It required very less resource,

- Disk : 50 MB (may require more space, when we store metrics data for long time)
- RAM : 100 MB
- Java SE : 1.8 or later

Test done up to 10 nodes and 30 sensors with the above configuration._

Supported Platforms

We can run it in any platform which supports Java. So far it has been tested in the following platforms, Kindly share your success stories on other platforms we can add it here.

- Linux
- Windows
- Raspberry PI (Oracle Java recommend)

Download

Executable download is available in two formats, zip and tar.gz. You can download suitable compressed flavor of yours.

- [mycontroller-dist-standalone-0.0.3.Alpha2-bundle.zip](#)
- [mycontroller-dist-standalone-0.0.3.Alpha2-bundle.tar.gz](#)

Kindly visit [releases page](#) of MyController.org to get latest version.

Configuration

Extract downloaded bundle where exactly do you want to run. Configuration file is located in `mycontroller/conf`

File name: `mycontroller.properties`

Temporary file

```
mcc.tmp.location=tmp/
```

You can change default location and file name. This file used as server temporary location and for the operation such as backup, restore, etc.,

Database Configuration

For supports only for H2DB, We have a [request](#) to support other RDMS databases

```
mcc.db.h2db.location=../conf/mycontroller ①
```

- ① You can change default location and file name. File will be stored with the file extension **.h2.db**. Do not add file extension here.

Database username and password are pre-configured. We cannot change it for now. Username: **mycontroller** and password is **mycontroller**

Web server configuration

```
mcc.web.bind.address=0.0.0.0 ①  
mcc.web.enable.https=true ②  
mcc.web.http.port=8443 ③  
mcc.web.file.location=../www/ ④  
mcc.web.ssl.keystore.file=../conf/keystore.jks ⑤  
mcc.web.ssl.keystore.password=mycontroller ⑤  
mcc.web.ssl.keystore.type=JKS ⑤
```

- ① bind interface address. by default it will bind with all the available interface.
- ② Enable/disable https. Only one protocol supported at a time. true - **https**, false - **http**.
- ③ Port number of **http/https** to access MyController.org server.
- ④ web files location, no need to touch this one.
- ⑤ If **https** is enabled these fields are mandatory.

Default URL: <https://<ip>:8443> (ex: <https://localhost:8443>)

Default username/password: **admin/admin**

Important: Change default **mcc.web.ssl.keystore.file** and **mcc.web.ssl.keystore.password** and **https** protocol is recommended

Logger configuration

Configuration File Name: **logback.xml**

Default log file location: **logs/mycontroller.log**

When to change log level, you can change it for specific package. Supported log levels are

- **TRACE** - It prints all the available logs
- **DEBUG** - It prints only debug, info, warn and error logs
- **INFO** - It prints only info, warn and error logs

- **WARN** - It prints only warn and error logs
- **ERROR** - It prints only error logs

Start/Stop Server

Executable scripts are located under **mycontroller/bin/**

- Linux
 - Start : **./start.sh**
 - Stop : **./stop.sh**
- Windows
 - Start : Double click on **start.bat**
 - Stop : **Ctrl+C**
- Other Platforms
 - Execute from 'mycontroller/bin/'
 - **java -Xms8m -Xmx100m -Dlogback.configurationFile=../conf/logback.xml -Dmc.conf.file=../conf/mycontroller.properties -cp "../lib/*" org.mycontroller.standalone.StartApp**

Assigning **-cp classpath** might vary on platforms, kindly refer java documents to know for your platform

Login

LOG IN TO **MYCONTROLLER.ORG**

Username

Password

Log In

Welcome to **MyController.org**! The Open Source Controller.
Version: **0.0.3.Alpha2-SNAPSHOT**
Demo account: username: **demo**, password: **demo**

Enter valid username and password to log in to MyController.org server.

Default username is **admin** and password is **admin**

Menus

Menu divided in to two parts.

Utility menu

You can perform changing display language(locale), changing password, email of logged in user, logout actions

Main menu

Sub menu

When you click on main menu you get list of sub menus list related to main menu.

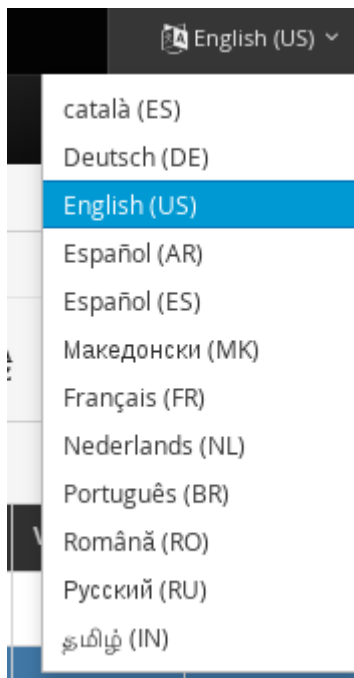

Across pages

You can see the following icons across pages.

-  *Filter by Name* - Filters
 - You change filter with available options.
 - Filter works with AND operation and case sensitive.
-  - Sort
 - you can sort based on fields listed in this menu
 -  - Ascending order
 -  - Descending order
 - To change order click on this icon
-  - View details
 - click this icon to know more about specified item
-  - Actions

- page to page list of actions will be different
- Select item(s) and perform action with this menu
- Icons
 - ● - Enabled
 - ○ - Disabled
 - ✓ - Up
 - ✗ - Down
 - ? - Unavailable

Language (locale)

MyController supports multiple locales. You can change to your language by selecting top right corner of language menu.

Support

- **Releases** - take you to MyController.org releases page
- **Documents** - take you to MyController.org documents page
- **Source code** - take you to MyController.org source code page

Utility menu

- **Profile** - take you to profile page. you can change password, email id and name.
- **Log out** - safely log out from MyController.org server

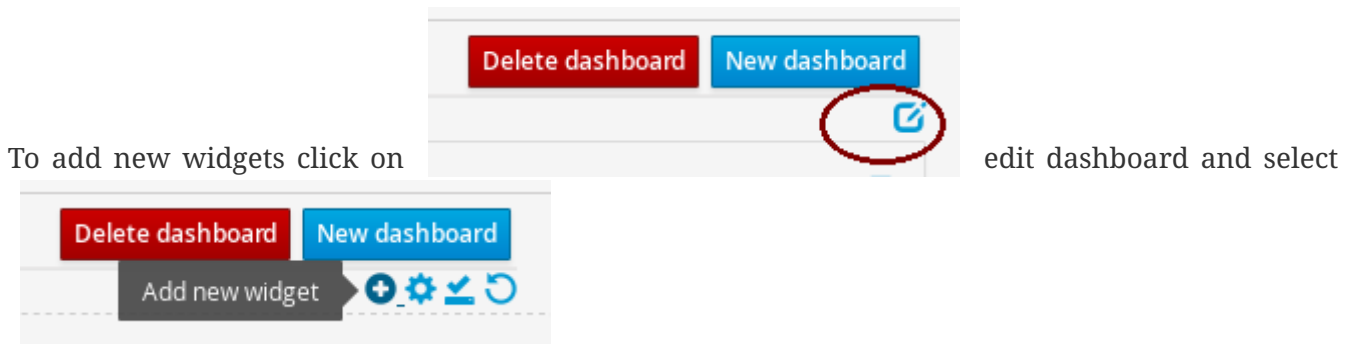

Dashboards

MyController dashboard supports for many number of widgets. If you do not find suitable on for you, you can use custom widget and use scripts for your requirements.

You can keep any number of dashboards. By default maximum dashboard count is set as 5. You can change this settings under **Settings >> System >> MyController**.

To remove a dashboard, select dashboard and click on **Delete dashboard**.

Add new widgets

Type of widgets

- **Sensors**
- **A sensor graphical view**
- **Grouped sensors graph**
- **Mixed sensors graph**
- **Sensors bullet graph**
- **Heatmap chart**
- **Sensors custom button**
- **Display image file**
- **Groups**
- **MyController time**
- **Sunrise and Sunset time**

- News
- Custom widget

Common settings across widgets

- Title - widget title
- Refresh time - refresh widget content, in seconds

Sensors

You can select any number of sensors to be displayed on this widget. You can limit number items per row by setting **Items per row**

JSON

```
[
  {
    "name": "<i class='fa fa-power-off'></i>",
    "payload": "P",
    "btnType": "danger"
  },
  {
    "name": "<i class='fa fa-play'></i>",
    "payload": "PL",
    "btnType": "success"
  },
  {
```

Cancel

Apply

Buttons detail should be in **JSON** format. To create **json** configuration error free way use <http://www.jsoneditoronline.org/> We can include button names as HTML or icons(recommended: font awesome icons)

In configuration **name** and **payload** are mandatory fields. **btnType** is optional and can be any one of **default**, **primary**, **success**, **info**, **warning**, **danger**

Example **json** as follows,

```
[
  {
    "name": "<i class='fa fa-power-off'></i>",
    "payload": "P",
    "btnType": "danger"
  },
  {
```

```

{
  "name": "<i class='fa fa-play'></i>",
  "payload": "PL",
  "btnType": "success"
},
{
  "name": "<i class='fa fa-pause'></i>",
  "payload": "PA",
  "btnType": "warning"
},
{
  "name": "1",
  "payload": "1"
},
{
  "name": "2",
  "payload": "2"
},
{
  "name": "3",
  "payload": "3"
},
{
  "name": "4",
  "payload": "4"
},
{
  "name": "5",
  "payload": "5"
},
{
  "name": "6",
  "payload": "6"
},
{
  "name": "7",
  "payload": "7"
},
{
  "name": "8",
  "payload": "8"
},
{
  "name": "9",
  "payload": "9"
},
{
  "name": "TXT",
  "payload": "TXT",
  "btnType": "primary"
},

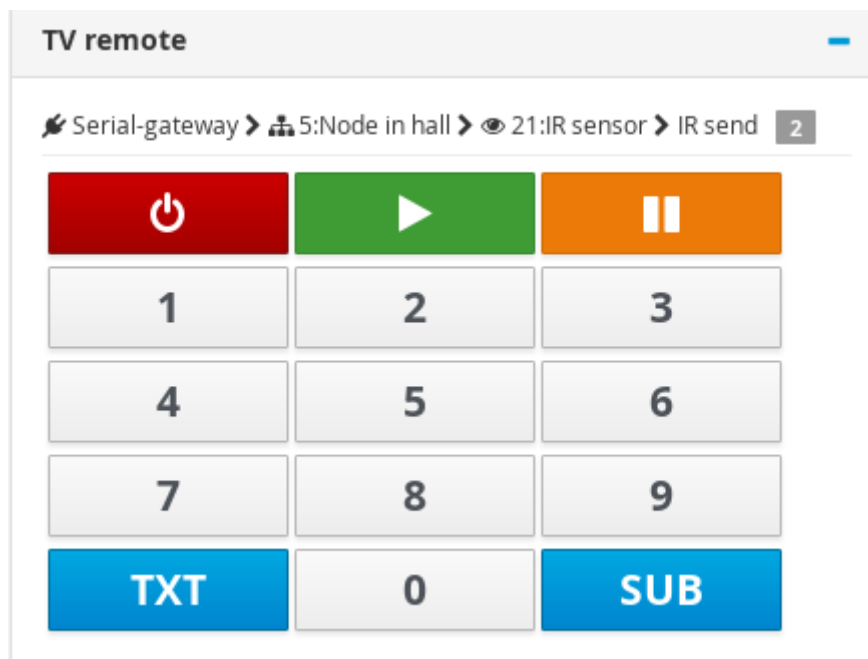

```

```

{
  "name": "0",
  "payload": "0"
},
{
  "name": "SUB",
  "payload": "SUB",
  "btnType": "primary"
}
]

```

Example produces,

Display image file

When you want to display image file from an **url** for from local **disk** you can use this widget. This can be used when you are updating image file with some other services and want to show in MyController dashboard.

06:43 PM

11.2333, 78.1667

News

Add **rss** feed and displays news from the feed.

General Discussion

- [Graphical widgets loading forever](#)
- [Restore backup on new mycontroller instance](#)
- [Inclusion mode not supported by this controller](#)
- [Relay Node](#)

Custom widgets

With the custom widget you can add on your interest. You have to write script for your custom widget.

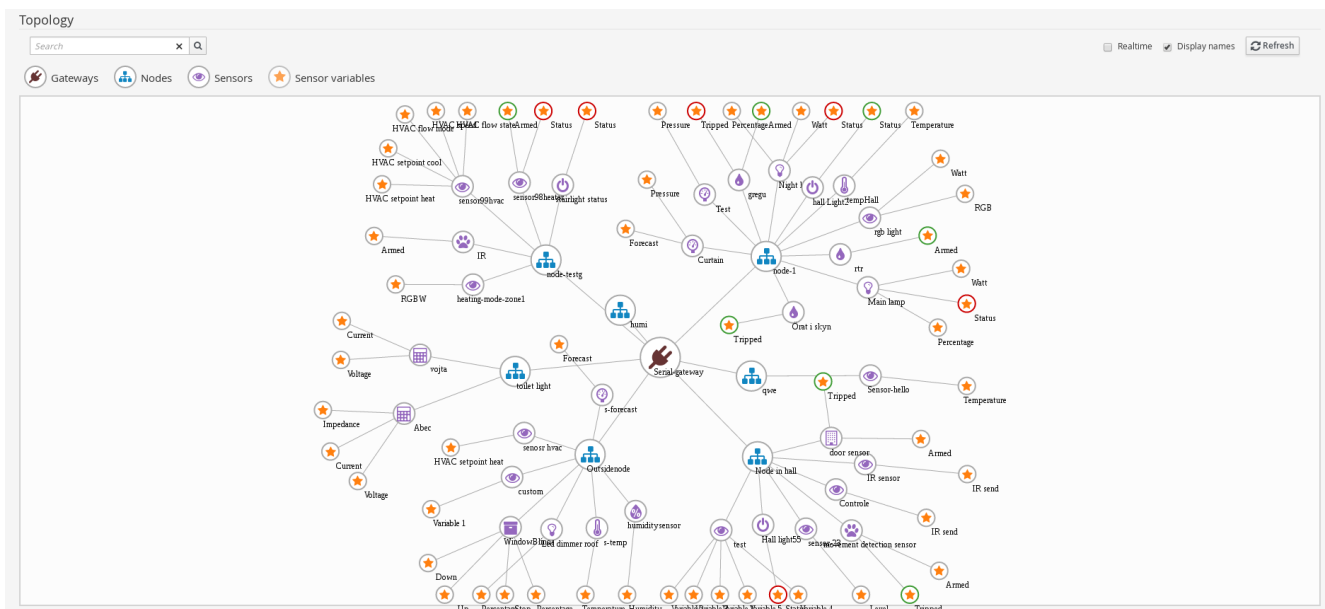

Rooms detail

When you mapped your sensors with room. You can access your room and get your sensors easily. You can perform actions also on sensor.

Topology

In topology graph you can see how the things connected in a quick view.

- **Realtime** - How is connected on real time (for now mysensors only supports) When you uncheck this option, shows how the things connected in MyController database.
- By clicking on top legends, you can show/hide type of resource.
- You may notice that circle color for nodes and gateways, If node or gateway is **UP** shows in green, otherwise based on status.
- Mouse over to resource, displays status of resource as tooltip
- **Display names** - Check/Uncheck to display/hide resources names
- When you click refresh topology graph gets refreshed (also doing automatic refresh also)
- You can filter resources on graph based on name
- When you double click on resources it will take you to resource details page.

Resources

Under resources you can do almost all actions related to sensors. can do actions on Gateways, Nodes, Sensors, Rules, Timers, Operations, Forward payload, Groups, Rooms.

Gateways

You can add remove any number of gateways. Supports 2 type of networks

MySensors

When you choose MySensors network type it supports 3 types

1. Serial gateway
2. Ethernet gateway
3. MQTT gateway

Sparkfun [phant.io]

It support REST API. Polls on configured REST API for every N seconds with X limits of data. It will not add duplicate data

Add gateway

Add gateway

Navigate to **Gateways** menu and click **Add gateway**.

Gateways actions

Gateway supports multiple actions. Select an item from the list and choose the desired action.

- **Reload** - reload operation performs stop and start of the gateways.

Reload can happen only for enabled gateways.

When you delete gateway. All the resources belongs to the gateways will be removed permanently. Always do backup when you perform this kind of operation.

Discover

Actions

3 Results

Enabled	Name	Type	Network type	Connection details	Status	Status since	Status message
<input checked="" type="checkbox"/>	Serial-gateway	Serial	MySensors	Port:dev/ttyUSB0, BaudRate:115200, Driver:Auto[SerialComm], RetryFrequency:6000 Seconds(s)		Feb 29, 2016 04:06:14	ERROR: Unrat
<input type="checkbox"/>	ether1	Ethernet	MySensors	Host:192.168.1.2, Port:5003		Feb 19, 2016 05:38:01	Disabled by
<input type="checkbox"/>	ether2	Ethernet	MySensors	Host:192.168.1.3, Port:5003		Feb 19, 2016 05:38:06	Disabled by user

Sends broadcast packet to all the node on this gateway. Will receive parent node details. Used in Topology page to show real time connection

Discover action supports only for MySensors

Node

Under this page you can see node information's like, Node EUI(Node Id), Node Name, Node Type,

Firmware Version, Core lib Version, Battery Level, Assigned firmware, etc.,

By default **Register nodes automatically** will be enabled under **Settings >> System >> MyController**. If this option is disabled, sensor data of the node will not be added in to MyController until node **Registration status** changed to **Registered**. You can also change a node **Registration status** to one of **New**, **Registered** or **Blocked**

Add manually

Navigate to node page, by clicking  button you can add new node.

Actions

- **Delete** - delete node
- **Erase configuration** - Ask node to erase complete configuration.
- **Reboot** - reboot the node
- **Upload firmware** - Request node to get firmware update
- **Refresh nodes info** - Requests presentation details from selected nodes

When you delete a node. All the resources belongs to the node will be removed permanently. Always do backup when you perform this kind of operation.

Node details

When you click  icon you will complete node details. includes battery usage report.

Mapping Firmware

Before doing this action, firmware should be added in MyController.org. Refer Firmware section to add new firmware. To update selected firmware in to selected node perform **Reboot** or **Update firmware** action.

Sensors

Navigate to sensors Page. In this page you see sensor details like Gateway Id, Node EUI, Sensor Id, Name, Type, Variable Type, Last seen. You can add, edit and delete sensors from here.

Add sensor

We can add sensors in two methods, via node and manually. If node sends any data related to sensors and if the sensor detail is not available in MyController.org new sensor will added

automatically. To add new sensor manually click on the button

If MyController.org receives any data related to sensor that you have added already will be overwritten.

Actions

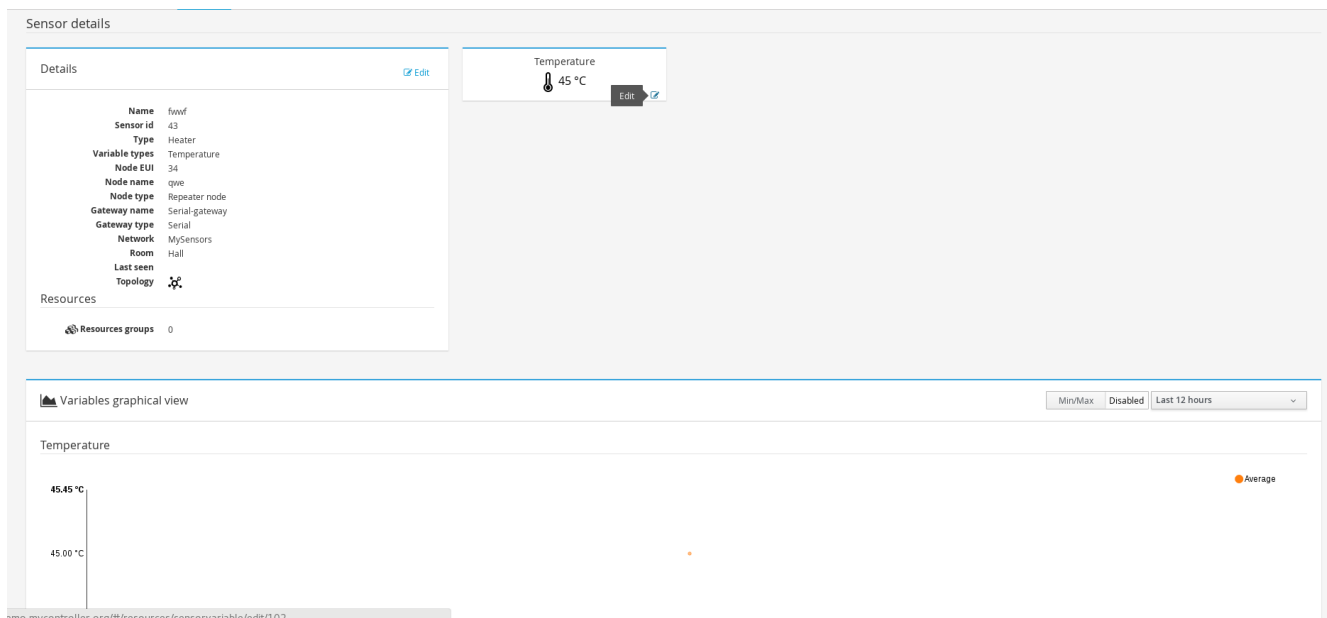

- **Delete** - delete selected sensor
- **Edit** - edit selected sensor

Deletion sensor will delete all the data relevance to that sensor. We cannot recover it back.

Edit Sensor variable

You can change sensor variable type, metric type, read only, graph type, etc., Go to sensors detail page.

Click on edit on **Sensor variable**

You can change the following settings,

- **Read only** - Makes this variable read only, you cannot send payload.
- **Metric type** - You can change metric type
 - **None** - When you do not want to record metric of a variable
 - **Double** - Used for double typed variables, like Temperature, Pressure, etc.,
 - **Binary** - Used for ON and OFF devices
 - **Counter** - Used to record counter type devices, like energy meters
- **Unit** - You can change any type of units. Can select **None** of no units measurement
- **Offset** - Only available for **Double** types metrics. You can enter **+** or **-** values. When MyController.org receives a data from this variable this **offset** will be added with actual value. When sending **offset** will be ignored(offset will not be included).
- **Priority** - This value used to display variables on different locations. When you give lowest number will get higher priority and vice versa.
- **Use global** - When this option set, will use global graph settings. Or you can override with your custom settings.

Update sensor variable

Sensor  Serial-gateway >  34:qwe >  43:Sensor-hello > Temperature

Rules

Formally called **Alarms**

Click on the button  to add new rule.

- **Name** - name of the rule definition
- **Enabled** - enable/disable this rule definition
- **Disable when trigger** - will be disabled automatically when triggers
- **Ignore duplicate** - ignore subsequent triggers. Will trigger again at least condition should not satisfy once.
- **Resource** - Select a resource, Supported resources,
 - **Gateway** - based on gateway status
 - **Node** - based on node status
 - **Sensor variable** - based on sensor variable value
 - **Resources group** - based on resources group status
- **Trigger when** - is a condition.
- **Dampening** - With dampening feature we can control trigger further. Types,
 - **None** - dampening option disabled
 - **Consecutive** - If the condition satisfies continuously for N occurrences.

- **Last N evaluations** - If the condition mets N occurrences in X evaluations.
- **Active time** - If the condition stays active in the specified time.
- **Operations** - We can add any number of operations for a rule definition.

Rules are used to trigger set of **Operations** when a condition met the specification. MyController supports multiple conditions.

Conditions type:

- Compare
- State
- Script
- String
- Threshold
- Threshold range

To add new **Rule**, Navigate to **Resources >> Rules >> Add rule**.

![0_1461341569745_rules-conditions.png](/uploads/files/1461341571011-rules-conditions.png)

Condition - Compare

We can compare **Sensor variable1** with **Sensor variable2**. **Example:** Hall-temperature >= 20% outside-temperature

Condition

Condition type: Compare

Trigger when: <= 15

Condition - State

With this condition we can monitor state of **Binary** type sensor variables, **Node**, **Gateway** and **Resources group**. **Example for Sensor variable**

Condition

Condition type: State

Trigger when: Serial-gateway > 5:Node in hall > 1:movement detection sensor > Tripped == On

Example for Node

Condition

Condition type: State

Trigger when: Serial-gateway > 2:Outsidenode == Up

Example for Gateway

Condition

Condition type: State Gateway

Trigger when: ether1 != Up

Example for Resources group

Condition

Condition type: State Resources group

Trigger when: Sunrise group (scene) == On

Condition - Threshold

With this condition we can monitor **Sensor variable** values with a static value or with another **Sensor variable** value

Example with static value:

Condition

Condition type: Threshold Serial-gateway > 2:Outsidenode > 34:humiditysensor > Humidity

Trigger when: <= Value 56

Example with another Sensor variable:

Condition

Condition type: Threshold Serial-gateway > 1:node-1 > 2:Night lamp > Percentage

Trigger when: >= Sensor variable Serial-gateway > 1:node-1 > 44:Test > Percentage

Condition - Threshold range

With this condition we can monitor **Sensor variable** value **Is in range?** or **Is in outside range?**

- **Threshold value low** (1) - low value of threshold
- **Threshold value high** (2) - high value of threshold
- **Include threshold low** - When we check this field included (1) in boundary
- **Include threshold high** - When we check this field included (2) in boundary
- **In range** - When you check this box will be act as **In range** check, otherwise **Out side range** check

Example: X inside [10,56], X outside [45, 200]

Example for In range:

Condition

Condition type: Threshold range Serial-gateway > 2:Outsidenode > 34:humiditysensor > Humidity

Trigger when: ☒ In range ☒ Include threshold low ☒ Include threshold high 60 90

Example for Out side range:

Condition

Condition type: Threshold range

Serial-gateway > 2:Outsidenode > 34:humiditysensor > Humidity

Trigger when: ☒ In range ☒ Include threshold low ☒ Include threshold high

60 90

Actions

- **Enable** - enable selected items
- **Disable** - disable selected items
- **Delete** - delete selected item
- **Clone** - clone the selected rule and create duplicate

Operations

Formally called **Notifications**

You can define any number of operations here. These operations will be mapped with **Rules** and **Timers**.

When a operation is in **Disabled** state, Even it's configured active **Rules** or **Timers** will no trigger disabled operations.

Add operation

To add new operation click on the button 

- **Name** - name of the notification
- **Enabled** - enable/disable notification.
- **Public access** - allow to use other users
- **Type** - type of operations
 - **Send payload** - Do resource operations.

- **Request payload** - Do resource operations.
- **Send SMS** - send SMS
- **Send email** - send email
- **Pushbullet note** - send pushbullet note
- **Execute script** - Executes mentioned script

Send payload

- Select resource and update payload
- **delay time in seconds** update this field with delay time. Using this option payload will send to the resource after x seconds of delay. If you do not want delay leave this field as blank.
- on the payload you can use **Special operations**. Refer Special operations section for further details.

Request payload

- Select a sensor variable to request current payload

This type supports only for MySensors

Send SMS

For SMS we can use [Plivo](#) or [Twilio](#) vendors. When you create trail account you will get some credit. To use SMS notifications you should configure either Plivo or Twilio SMS API settings under **Settings-→Notifications-→SMS**.

- **Phone numbers** - Give destination numbers with '+' with country code then mobile number without any space. If you want to give more than one number use comma(,)
- **Custom message** - If you leave this field blank, default message will be generated. ===== Send email To send email, SMTP email settings should be configured under "Settings-→ Notifications-→Email"
- **Subject** - subject of this email. Mandatory field. You can apply **keys** for this filed.
- **Email(s)** - list of email address with comma(,) separated. Email subject as well as body message supports for `key's

Pushbullet note

To send pushbullet note, Pushbullet settings should be configured under "Settings-→ Notifications-→Pushbullet"

- **Devices** - comma(,) separated device **iden**. If you leave blank will send to all the devices.
- **Title** - Title of the pushbullet note. You can apply **keys** for this filed.
- **Custom message** - You can add your own custom message. If you leave this field blank default message will be taken. You can apply **keys** for this filed.

SMS, Email, Pushbullet note supports for custom messages with keys. `key's will be replaced with actual value on runtime.'

Supported keys on custom messages

You can apply the following keys for this filed.

- `notification.ruleName` - Rule definition name
- `notification.ruleCondition` - Rule condition details
- `notification.actualValue` - Actual value of the resource at the time of trigger
- `notification.triggeredAt` - Rule trigger time
- `notification.operationName` - Operation name

Custom message example: Inside temperature goes too high! Current temperature is `${notification.actualValue}`

Special operations

While defining payload you can assign following special operations, All the special operation reads last received/sent value from target senor and doing this operation on top of that value and sends to target sensor.

Toggle

By assigning the value: **Toggle** You can select this operation. It is doing toggle operation. This will be useful for 'BINARY' devices. For example if switch is **ON** it will be turned **OFF** vise versa.

Increment

By assigning the value: **++** You can select this operation. Adding 1 with the value. Example: last rx/tx value is 45, on resulting this operation will send 46 to target sensor.

Decrement

By assigning the value: **--** You can select this operation. Subtracting 1 with the value. Example: last rx/tx value is 45, on resulting this operation will send 44 to target sensor.

Addition

By assigning the value: **+3** You can select this operation. Here + meant for addition and 3 is the value should add. Example: last rx/tx value is 45, on resulting this operation will send 48 to target sensor.

Subtraction

By assigning the value: **-4** You can select this operation. Here - meant for addition and 3 is the value should add. Example: last rx/tx value is 45, on resulting this operation will send 48 to target sensor.

Multiplication

By assigning the value: ***2** You can select this operation. Here * meant for multiplication and 2 is the value should multiple. Example: last rx/tx value is 45, on resulting this operation will send 90 to target sensor.

Division

By assigning the value: **/3** You can select this operation. Here / meant for division and 3 is the value should divide by. Example: last rx/tx value is 45, on resulting this operation will send 15 to target sensor.

Modulus

By assigning the value: **%4** You can select this operation. Here % meant for modulus and 3 is the value used for modulus. Example: last rx/tx value is 45, on resulting this operation will send 1 to target sensor.

Start

By assigning the value: **start** You can select this operation. On this operation target resource will be started.

Stop

By assigning the value: **stop** You can select this operation. On this operation target resource will be rebooted.

Reboot

By assigning the value: **reboot** You can select this operation. On this operation target resource will be rebooted.

Reload

By assigning the value: **reload** You can select this operation. On this operation target resource will be rebooted.

Enable

By assigning the value: **enable** You can select this operation. On this operation target resource will be enabled.

Disabled

By assigning the value: **disable** You can select this operation. On this operation target resource will be disabled.

ON

By assigning the value: **ON** You can select this operation. On this operation target resource will be ON.

OFF

By assigning the value: **OFF** You can select this operation. On this operation target resource will be OFF.

Timers

MyController.org using [Sundial](#) scheduler which forked from [Quartz Scheduler](#)

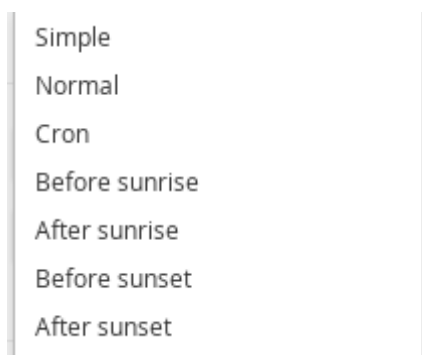

With the timer you can schedule timely operations for resources which configurable in **Operations**. Different types of timers are supported by MyController.org. You can schedule a timer till seconds(via API only, in GUI supports only till minutes only except **cron** type). Means you can

schedule a task for time **21:45:23** like that. By Clicking button  you will be taken to add timer page.

- **Name** - name of the timer
- **Enabled** - enable/disable the timer
- **Timer type** - type of the timer
- **Validity** - validity of the timer. If you leave blank never get expired.
- **Operations** - Select list of operations that you want to run when this timer triggers

Timer types

Simple

Simple timer operates with **Repeat interval** and **Repeat count**. Specify repeat interval in seconds. If you want to run this job count less specify **Repeat count** as **-1**

Normal

Normal is a very basic and classic timer. You can select **Normal** in the type drop down.

Cron

Cron is for advanced users. It is simple and easy. Visit [Quartz-Scheduler](#) page for further detailed configuration

Quartz-Scheduler cron supports from seconds.

Before Sunrise, After Sunrise, Before Sunset and After Sunset

If your task based on Sunrise or Sunset you have to go with this option. Say you want to control your garden light based on your location sun rise and sun set time. You can use this option. You can specify time offset.

Frequency

3 types of frequencies supported by MyController.org

1. Daily – you can select all the 7 days or day(s) only you want to run
2. Weekly – Select a day in week
3. Monthly – Select a day in month

Time

Time format: **HH:mm:ss**

HH – hour in 24 hours format (0~23)

mm – minutes (0~59)

ss – seconds (0~59)

For sunrise and sunset options "Time" will react differently. If you select After Sunrise and After Sunset time offset will be added with "Time" mentioned in task + "Sunrise" or "Sunset" time. If you select "Before Sunrise or Before Sunset" "Time" mentioned in task time offset will be subtracted from actual "Sunrise or Sunset" time.

Validity

You may feel you do not want to run this job all the time and want to run only on particular window period. In that case you can select validity. You can select "Validity From" and "Validity To" or only either or nothing. If you do not select any validity that job will be treating like never end. If you select only "Validity From" job will run from that date and never end. If you select only "Validity To" that job will start immediately and will end on the specified date.

Operations

You can select **N** number of operations for a timer. All the operations will be executed when a timer triggers

Forward Payload

You can forward the data received by this sensor to another sensor directly without any condition. This will be useful when you want to send your sensor data to multiple sensors. No need to do any code change on sensor side. Simply add an entry in MyController.org and be happy, MyController.org will take care rest of the things.

This operation supported across gateways too. Which means you can forward data from one network to another network.

Add new entry

To add new entry click on the button

Add an entry

A screenshot of the 'Add forward payload entry' form in the MyController.org interface. The form has a light gray background. It contains three main sections: 'Enabled' with a checked checkbox, 'Source' with a dropdown menu showing 'ether2 > 1:MyNode > 1:aaa > Tripped', and 'Destination' with a dropdown menu showing 'Serial-gateway > 1:node-1 > 2:Night lamp > Status'. At the bottom right, there are 'Cancel' and 'Save' buttons.

Actions

- **Delete** - Delete selected entries
- **Edit** - If there is a change required
- **Disable** - Temporarily you do not want to forward
- **Enable** - Enable disabled entries

Groups

Groups is the place where you want to keep group of resources and perform actions on all resources on single click. Generally it needs **On payload** and **Off payload** for each resource.

Add group

To add new group click on the button  and update **Name** of the group and group **Description**

Add resource

Supports for resource **Gateway**, **Node** and **Sensor variable**. To add resources in to a groups click on

Add an entry

Resource

Resource

Payload

ON

OFF

Payloads for Gateway

- **Start**
- **Stop**
- **Enable**
- **Disable**
- **Reload**

Payloads for Node

- **Reboot**

Rooms

Rooms is used to organize your sensors as you see in your home/office. You can create nested rooms also. Example: **Floor1 >> Hall >> TV**

Add room

To add new room click on the button  and update **Name** of the room and room

Description If it is nested room, select parent room. You can select **Sensor** from here as well as from sensors page.

A sensor can be mapped with only one room!

Send

Status

With status pages to can get status about your sensors and MyController. In simple word this is the place to debug the things.

About

About page lists quick details about MyController's configurations.

MyController

Version	0.0.3.Alpha2-SNAPSHOT
Database version	1.02.09 - 2016 Jul 16
Git commit:branch	360026d9877fcd40ba77f478b7fa3e8e52ea31ac:development
Built on	2016-07-25T23:11:37+0530
Build JDK	1.8.0_92
Build tool	Apache Maven 3.3.9

Java virtual machine specification

VM vendor	Oracle Corporation
VM name	Java HotSpot(TM) Client VM
VM version	1.8.0_65-b17
Java home	/home/pi/jdk1.8.0_65/jre

Operating system

Operating system	Linux
Architecture	arm
Version/Kernel	4.4.11-v7+
Location	/home/pi/mycontroller

[Run garbage collection](#)

Operating system

Gives detail about current operating system.

Operating system	Linux
Architecture	arm
Version/Kernel	4.4.11-v7+
Available process	4
System load average	9.00 %
System cpu load	0.00 %
Process cpu	Load: 0.00 %, Time: 9681930 milliseconds
Physical memory (RAM)	Free: 499 MB, Total: 925 MB
Swap space	Free: 99 MB, Total: 99 MB
Committed virtual memory size	242 MB
User working directory	/home/pi/mycontroller/bin

Script engines

Gives detail about supported script engines. By default following script engines are shipped with MyController,

- **Oracle Nashorn** - Supports to execute **Java scripts**
- **Groovy Scripting Engine** - Supports to execute **Groovy** scripts
- **freemarker** - It is template engine used across MyController

You can add any number of script engines. If it supports for **JSR 223** specifications.

1) Groovy Scripting Engine

Name	Groovy Scripting Engine
Version	2.0
Language	Groovy
Language version	2.4.6
Extensions	groovy
Alias	groovy, Groovy

2) freemarker

Name	freemarker
Version	2.3.20
Language	freemarker
Language version	2.3.20
Extensions	ftl
Alias	freemarker, Freemarker, FreeMarker

3) Oracle Nashorn

Name	Oracle Nashorn
Version	1.8.0_92
Language	ECMAScript
Language version	ECMA - 262 Edition 5.1
Extensions	js
Alias	nashorn, Nashorn, js, JS, JavaScript, javascript, ECMAScript, ecmascript

4) jython

Name	jython
Version	2.7.0
Language	python
Language version	2.7
Extensions	py
Alias	python, jython

Steps to add new script engine

Download jar file and place it under `mycontroller/lib/` and restart MyController services.

For example if you want to add `Python` support on MyController, you need to add `Jython` library.

- Download `jython-standalone-*.jar` from [Jython](#) website.
- Place it under `mycontroller/lib/`
- Stop MyContorller
- Start MyController

Resources logs

In this page you can understand what's going on about your sensors network. It is a good place to do debugging about your sensors.

By clicking **Purge** button on this page, you can remove all existing logs or selected logs with filter.

MyController server log

In this page you can watch backend log file `mycontroller/log/mycontroller.log` from GUI.

Utilities

Under utilities you can store scripts, templates, additional headers, variables repository, UID tags, firmwares, external servers details.

Scripts

MyController supports for custom scripts, they can be used to perform any kind of operation or in **Rule**. MyController gives set of API for your needs. With this API's you can query/set data in MyController.

Two types of scripts are available,

- Condition
- Operation

Condition

Condition scripts are used for **Rule** engine. If you are not satisfied with pre defined rule conditions you can write your own script. Your script should return either **true** or **false** or inside script set **mcResult** variable as boolean value.

In python return **true** or **false** will not work. set your result in **mcResult** variable.

Operation

Operation scripts are used for other than **Rule** engine condition type. Can be used on **Operation**, **Dashboard**, etc.,

Script examples

Script's API: [javadoc](#) API's are added in script environment. You can access any supported API's with mcApi object.

Java script

Take an example I want to display last seen of node details in dashboard.

```
var myImports = new JavaImporter(java.io, java.lang, java.util); ①

with(myImports) { ②
    var options = new HashMap(); ③
    //Sort by lastSeen.
    options.put("orderBy", "lastSeen"); ④
    //Order by descending
    options.put("order", "desc"); ⑤
    //Page limit, only 5 result
    options.put("pageLimit", new Long(5)); ⑥
    //Get nodes data
    var nodes = mcApi.node().getAll(options); ⑦
}
```

- ① Import required packages for our coding. **JavaImporter** is used to import packages. You can import any number of packages with comma separated.
- ② Add our imports **with** loop
- ③ Create a **HashMap** to add our query filter values.
- ④ Adding a filter **orderBy** as **lastSeen**
- ⑤ Adding another filter **order** as **desc**
- ⑥ Adding another filter **pageLimit** as **5**
- ⑦ Store queried results in the variable **nodes**, can be used in templates(refer templates section)
mcApi already binded with script engine, you can use it to query/set values from/to MyController.

Groovy script

I want to print serial gateways on MyController log file.

```
import org.mycontroller.standalone.gateway.GatewayUtils.GATEWAY_TYPE ①
def filters = [name: 'Serial-gateway', pageLimit: 10L, type: GATEWAY_TYPE.SERIAL] ②
def queryResponse = mcApi.gateway().getAll(filters) ③
mcApi.logger().info("Query Response:{", queryResponse) ④
```

- ① Import `GATEWAY_TYPE` enum, will be used to filter
- ② Create filter list with filter values, Filtering with gateway `name` contains `Serial-gateway` (case sensitive), `type` as `GATEWAY_TYPE.SERIAL` and limiting count on request as 10 `10L` with the key `pageLimit`
- ③ Calling MyController API (`mcApi.gateway().getAll(filters)`) with our filter
- ④ Printing result under `mycontroller/log/mycontroller.log` as `INFO` log.

When log level set at `ERROR`, `INFO` logs will not be printed!

Python script

In this script we are getting gateways detail and printing in log file.

```
from java.util import HashMap ①
from java.lang import Long ②
options = {'pageLimit': Long(20)} ③
gateways = mcApi.gateway().getAll(HashMap(options)) ④
mcApi.logger().info("Quesry Response:{", gateways) ⑤
```

- ① Import `HashMap` should be used to send filter queries
- ② Import `Long` used to send java `Long` type
- ③ Create filter with `pageLimit` of `20`
- ④ Query MyController with `McApi` and store result in `gateways`
- ⑤ Print result in `mycontroller/log/mycontroller.log` file.

Add script

To add new script click on  Enter `Name` of the script, `Extension` type, script type(`Type`) and script content. You can select script from files also.

Once you have added script you may want to test, is it working as expected. To test script Select your script and click on  `Run now` from actions list. You will get a page to feed bindings options as displayed here,

Run now
✕

Script	operations/get-temperature.js
Script bindings	<input style="width: 90%; border: 1px solid #ccc;" type="text" value="{}"/>

✕ Cancel
▶ Run

You can feed `script bindings` and click on `Run Result(json format)` will be displayed on the same

page as follows,

Run now

Script

operations/get-temperature.js

Script bindings

{ "myKey": "hello" }

Result

```
{
  "myKey": "hello",
  "uuid": "007027a5-7e21-456d-a50d-7f7d909e8c56",
  "temperatureSen": {
    "id": 35,
    "uid": "temperature",
    "sensorVariable": {
      "id": 7,
      "sensor": {
        "id": 4,
        "sensorId": "1",
        "type": "S_TEMP",
        "name": "s-temp",
        "lastSeen": 1469783363528,
        "node": {
          "id": 2,
          "eui": "2",
          "gatewayTable": {
```

Cancel

Run

script bindings should be in **JSON** format.

Templates

Templates are used to send email and in dashboard for custom widgets. MyController uses [freemarker](#) as template engine. Refer the [docs](#) for the complete format supports.

Syntax example

This template used to display nodes status on dashboard. To run this template you have to select example scripts that queries node status.

```

<table class="table table-hover table-bordered table-striped mc-table">
  <thead>
    <th>Status</th>
    <th>EUI</th>
    <th>Name</th>
    <th>Type</th>
    <th>Battery level</th>
    <th>Last seen</th>
  </thead>
  <tbody>
    <#list nodes.data as item> ①
      <tr>
        <td class="text-center">
          <#if item.state == "UNAVAILABLE"> ②
            <i class="pficon pficon-help text-color-gray fa-lg"></i>
          <#elseif item.state == "DOWN">
            <i class="pficon pficon-error-circle-o fa-lg"></i>
          <#elseif item.state == "UP">
            <i class="pficon pficon-ok fa-lg"></i>
          </#if>
        </td>
        <td>${item.eui}</td>
        <td>${item.name}</td>
        <td>${item.type.text}</td> ③
        <#if item.batteryLevel??>
          <td><span>${(item.batteryLevel)! "-" } %</span></td> ④
        <#else>
          <td><span>-</span></td>
        </#if>
        <td><span uib-tooltip="{{${(item.lastSeen)!} |
date:mc-helper.cfg.dateFormat:mc-helper.cfg.timezone}}" tooltip-placement="left" am-
time-ago="${(item.lastSeen)! 'Never'}"></span></td>
      </tr>
    </#list>
  </tbody>
</table>

```

- ① for loop in template, from script we will get `nodes` object and fetching items one by one.
- ② if condition, checks node state (enum type)
- ③ we can call methods with `.(DOT)` notation. `${item.type.text}` is equalient to `item.getType().getText()`
- ④ Ignore `null` and assign default value.

To allow `null` you have to add `!` at the end of statement `>> ${item.lastSeen}!`, If you want to put default value on `null` value `>> ${item.lastSeen}! "-"`

Add template

To add new template click on  and save with template **Name** and **Content** as shown in syntax example

Run template

You may want to test your template immediately. For this go to list templates page and select your template and click on  **Run now** you will get a popup. You have select supported script for this template. If script is not required for this template leave this as blank. And add **json** bindings if needed.

Run now 

Template

nodes-last-seen.html

Script

operations/nodes-last-seen.js 

Script bindings

{ }

 Cancel

 Run

When you click **Run** selected script executed with **Script bindings** on back-end and script out put will be passed to template. Final result will be displayed on the pop-up as shown below.

Run now 

Template

nodes-last-seen.html

Script

operations/nodes-last-seen.js 

Script bindings

{ }

Result

Status	EUI	Name	Type	Battery level	Last seen
	0	Gateway node	Repeater node	-	
	3	Water Level Sensor Node	Repeater node	-	

 Cancel

 Run

if you do not select any script, **Script bindings** directly passed to template engine.

HTML additional headers

When there is situation like you have different widgets available on different sites and you want to use there own **js** or **css** along with MyController, here is the place to add those scripts and style sheets. You can also add your own custom **angular JS controllers**

HTML additional headers

CSS files	<div></div>
Script files	<div>http://bernii.github.io/gauge.js/dist/gauge.min.js</div>
AngularJS custom controllers	<div></div>

Cancel Save

When you do changes in **HTML additional header**, once you saved the changes, to reflect changes on your current browser session do browser refresh **F5**

Variables repository

With the support of variables repository you can keep some configurations here and use it across in scripts and templates.

Each reference has 4 fields, **key**, **value**, **value2** and **value3**.

Add a variable

To add a variable click on

Add variable

 buttons and

Add variable

Key	<input type="text" value="myKey"/>
Value	<input type="text" value="hello"/>
Value #2	<input type="text" value="mycontroller"/>
Value #3	<input type="text" value="awesome"/>

Example(JavaScript):

```
var variable = mcApi.variable().get("myKey"); ①
variable.getKey() ②
variable.getValue() ③
variable.getValue2() ④
variable.getValue3() ⑤
```

- ① Get variable called **myKey**
- ② Get the **key** for this variable, must be **myKey**
- ③ Get **value**
- ④ Get **value2**
- ⑤ Get **value3**

There is no field called **value1**. Do not try to call **value1**

UID Tags

Dashboards
Resources
Action board
Status
Utilities
Settings

</> Scripts
Templates
HTML additional headers
Variables repository
UID tags
Firmwares
Resources data
External servers

By script calling sensors variables you need lot of info like **gateway** details, **node** details etc., To bypass this we can **tag** a sensor variable with **String UID** and called from your script with this **UID**

Add new entry

To add new entry click on and follow,

Add UID tag entry

UID	<input type="text" value="temperature-out"/>
Sensor variable	<input type="text" value="Serial-gateway > 2:Outsidenode > 1:s-temp > Temperature"/>

In script (Java script)

```
var sensorVariable = mcApi.uidTag().getByUid("temperature-out"); ①  
mcApi.logger().info("Sensor variable Details: {}", sensorVariable); ②
```

① Get **Sensor variable** object with UID **temperature-out**

② Print received object on logger file (**mycontroller/log/mycontroller.log**)

Firmware

You can control node firmware with the help of MYSBootloader or DualOptiboot-bootloader.

Your node should be running with the bootloader either **MYSBootloader** or **DualOptiboot-bootloader**

What you can do?

- Upload new firmware
- Change existing firmware to new latest
- Maintain nodes firmware up to date

Each **firmware** is maintainable with **Type** and **Version**. You can keep **N** number of version on each type.

Add Firmware Type

Click on **Type** you will get firmware type page. Clicking **Add firmware type** you can add new firmware type.

Id for the firmware type will be generated automatically. If you leave 'Type Id' as blank.

Add Firmware Version

Click on **Version** you will get firmware version page. Clicking on **Add firmware version** you can add new firmware version. While adding firmware version you can leave 'Version Id' as blank. Id will be generated automatically. If you have any requirement for specified id add it.

Id for the firmware version will be generated automatically. If you leave 'Version Id' as blank.

Add Firmware

When you click **Firmwares** on top menu, you will be landed on firmwares page. If you are in firmwares **Type** or **Version** page you will reach by clicking on

Clicking **Add firmware** you can add new firmware. Select Firmware type and version from the pop-up and select .hex from your local computer. Finally click Add. Your firmware is ready for actions.

External servers

When there is need to keep all your sensors metrics on external servers. You have to put an entry here.

Supported external servers

- Emoncms.org
- Influxdb
- Sparkfun [phant.io]

You can add any of the supported server on this page and map your resources with your server. MyController will take care rest of things.

To add external servers click on **Add external server**

Common fields across servers,

- **Name** - Name it your server
- **Type** - select your server type
- **URL** - Your server url
- **Trust host** - select trust host type
- **Key format** - How your resource **key** should be formed, Supported variables **\$nodeName**, **\$nodeEui**, **\$sensorName**, **\$sensorId** and **\$variableType**

When your external server configured with **SSL** certificate, connection will fail. To bypass **SSL** certificate use **Any** as **Trust host**

Emoncms.org server

- **Write API key** - get this key from Emoncms.org server account page.

Name	<input type="text" value="My emoncms.org"/>
Enabled	<input checked="" type="checkbox"/>
Type	<input type="text" value="Emoncms.org"/>
URL	<input type="text" value="https://emoncms.org"/>
Trust host	<input type="text" value="Any"/>
Write API key	<input type="text" value="YG5LEzNZp8i2xbd1dmnb"/>
Key format	<input type="text" value="\$nodeEui_\$sensorId_\$variableType"/>

Influxdb server

- **Username** - username of influxdb
- **Password** - Password of influxdb
- **Database** - Database name of influxdb
- **Tags** - You can assign any number of tags with comma separated.

You can leave **username** and **password** fields as blank if you do not have

Name	<input type="text" value="my influx db server"/>
Enabled	<input checked="" type="checkbox"/>
Type	<input type="text" value="Influxdb"/>
URL	<input type="text" value="https://<host-ip>:8083"/>
Trust host	<input type="text" value="Any"/>
Username	<input type="text" value="influxuser"/>
Password	<input type="text" value="influxpassword"/>
Database	<input type="text" value="mydb"/>
Tags	<input type="text" value="host=mycontroller,location=Zurich"/>
Key format	<input type="text" value="\$nodeEui_\$sensorId_\$variableType"/>

Sparkfun server

- **Public key** - Public key of your Sparkfun account
- **Private key** - Private key of your Sparkfun account

You have to create Sparkfun account with only one field. If you have more than one field sending will failed. Because MyController sends only one sensor variable data with timestamp. Kindly note **key** is case sensitive in Sparkfun.

Name	<input type="text" value="my sparkfun server"/>
Enabled	<input checked="" type="checkbox"/>
Type	<input type="text" value="Sparkfun [phant.io]"/>
URL	<input type="text" value="https://data.sparkfun.com"/>
Trust host	<input type="text" value="Any"/>
Public key	<input type="text" value="YG5LEzNZp8i2xbd1dmnb"/>
Private key	<input type="text" value="KjylpjWa4MSr3A6rOZ12"/>
Key format	<input type="text" value="\$nodeEui_\$sensorId_\$variableType"/>

Resources data

Once you have created **External servers**, now it's time to configure what are resources data to be sent to external server and to who are all. For all these you have to configure **Resources data**

Supports for 4 types of resources,

- **Gateway** - Sends all the **Sensor variable's** data under this '**Gateway**' to external server(s)
- **Node** - Sends all the **Sensor variable's** data under this '**Node**' to external server(s)
- **Sensor** - Sends all the **Sensor variable's** data under this '**Sensor**' to external server(s)
- **Sensor variable** - Sends only this data to external server(s)

Add resources data

To add new entry click on **Add Resource** and follow as shown bellow,

You can disable sending data at any time. We can do disable in two locations. If you do not want to send data to particular server, do disable on **External servers** page. If you do not want to send particular resource data, do disable on **Resources data** page

Settings

This is the location where you can control various global settings.

Profile

You can change your logged in user **Full name**, **Email**, **Password** here.

 Profile

Username	jeeva
Full name	<input type="text" value="jeeva Kandasamy"/>
Email	<input type="text" value="jeeva123@gmail.com"/>
Current password	<input type="password" value="Current password"/>
New password	<input type="password" value="New password"/>

System

Under system, you can see location settings and MyController settings

Location

You can see **Sunrise** and **Sunset** on **Rule**. Time will be calculated based on this location settings. By clicking **Update** current location will be taken from your browser and will be updated.

You need internet connection to get current location from browser. however to calculate **sunrise** and **sunset** time, internet is not required.

 Location

	06:05 AM
	06:43 PM
Location	<input type="button" value="Update"/>
Latitude	<input type="text" value="11.2333"/>
Longitude	<input type="text" value="78.1667"/>

MyController

Here you can set many settings, which used globally.

- **Nodes alive check interval** - Every 30 minutes (default) once nodes alive status will be calculated. MyController will send **Ping** to all the nodes. If there is not data for last 30 minutes, node will be marked as down. You can change this interval.
- **Execute discover interval** - Every 30 minutes once this util will be executed. By executing this util real time topology page will be updated.
- **Units configuration** - You have to define here that you want to use **Metric** or **Imperial**
- **Register nodes automatically** - When you disable this button, when new nodes added automatically, **Registration status** will be kept as **New**, data will not be logged from this node until the registration status changed to **Registered**.
- **Resource logs level** - You can define here, what time of sensors logs should be captured.
- **Maximum dashboards allowed** - You can change this settings when you required more than 5 dashboards.
- **Table rows limit** - This settings used across all the tables on MyController
- **Global page refresh time** - Where and all auto page refresh is happening, this interval will be used.
- **Language** - MyController supports many locale. You can set parmenantly your language here.
- **Time format** - You can set MyController should you 12 hours format or 24 hours format
- **Grant access to child resources** - When you create role, if you assign a **Gateway** do you want to control only the **Gateway** or all the resources on the **Gateway**. This is applicable for nodes too.
- **Widget image file disk location** - There is widget on dashboard **display static image**. Local

images are taken from this location. Due to JVM memory issue. There is a restriction on image size. allowed size only up to 7 MB.

- **Login message** - You can sent your own login message. This message will be displayed on login page.

Don't you see you language? Or not fully changed to your locale? Please contribute on [Locale project](#)

Resource logs level is different than MyController logs. To change MyController log level change it on [mycontroller/conf/logback.xml](#)

License

[Apache License version 2.0](#)

Apache License
Version 2.0, January 2004
<http://www.apache.org/licenses/>

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition,

"control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable

copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.
4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:
 - (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and
 - (b) You must cause any modified files to carry prominent notices stating that You changed the files; and
 - (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and
 - (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided

that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. **Submission of Contributions.** Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensors shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensors regarding such Contributions.
6. **Trademarks.** This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensors, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.
7. **Disclaimer of Warranty.** Unless required by applicable law or agreed to in writing, Licensors provide the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.
8. **Limitation of Liability.** In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.
9. **Accepting Warranty or Additional Liability.** While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf

of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "{}" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.

Copyright {yyyy} {name of copyright owner}
